

# FUEL FILTERS

**OUR FUEL FILTER CATEGORY CONTINUES TO GROW, RECENTLY INCREASING OUR COVERAGE BY 20%.**

This is significant due to the fact that many fuel filters are unserviceable. Currently we have 256 fuel filter part numbers – 209 for gas engines; 47 for diesel engines.

**NAPA fuel filters offer a wide range of application coverage including a variety of designs and materials that matches the OEM fit, function and performance.**

Quality fuel filters are essential for protecting fuel injection systems from contaminants that may be in the fuel, ensuring optimal performance and fuel economy. Often, fuel has contaminants originating from service station tanks or from corrosion in fuel system components as a vehicle ages. Dirt, rust and water are the major impurities present in fuel. These contaminants can plug injectors and carburetors which can cause engine malfunction. NAPA fuel filters are engineered for a long life of extended service intervals.
